Smart Email Generator for Students

- High Level Design (HLD)

Low-Level Design (LLD)

- **Frontend (React.js)**

- **App.js**

- I'm using **React Router** for navigation between the main screens.
- The homepage acts as a landing interface where users can select:
 - Generate Email
 - Check Grammar & Format

```
<Routes>
```

```
<Route path="/" element={<Home />} />
```

```
<Route path="/generate" element={<EmailGenerator />} />
```

```
<Route path="/check" element={<GrammarCheck />} />
```

```
</Routes>
```

- **Home Component**

- This is a simple card-style UI that gives users a clear choice on what they want to do.
- I've styled the buttons with fixed dimensions and added purple as the primary color for branding consistency.

- **Features:**

- Prompt title and subtext
- Two CTA buttons leading to generation and grammar-checking flows

- **Pages**

- **EmailGenerator.js**

- Handles the email generation from user prompt.
- Inputs include:
 - **Prompt Text**
 - **Category** (dropdown: Leave, Complaint, etc.)
 - **Tone** (dropdown: Formal, Polite)
 - **Etc..**

- After submission:
 - The data is sent to the backend (/generate-email)
 - Response includes a well-structured and grammatically correct email
- **2. GrammarCheck.js**
 - This page accepts a custom user-written email.
 - Once submitted, the text is sent to the backend (/check-grammar)
 - The corrected version is returned and shown to the user with options to edit or export.
- **Design Elements**
- **Blobs** in the background are animated using CSS and give a unique and modern look to the interface.
- Centralized container with max-width for better responsiveness.
- Buttons are styled consistently with rounded corners and flex properties to align icons and text.
